Medic Center

NEW MARKER M2BPGi IN LIVER FIBROSIS EVALUATION-

EXPERIENCE IN CLINICAL PRACTICE

Associate Professor Pham Thi Thu Thuy.

Medic Medical Center, Ho Chi Minh city.

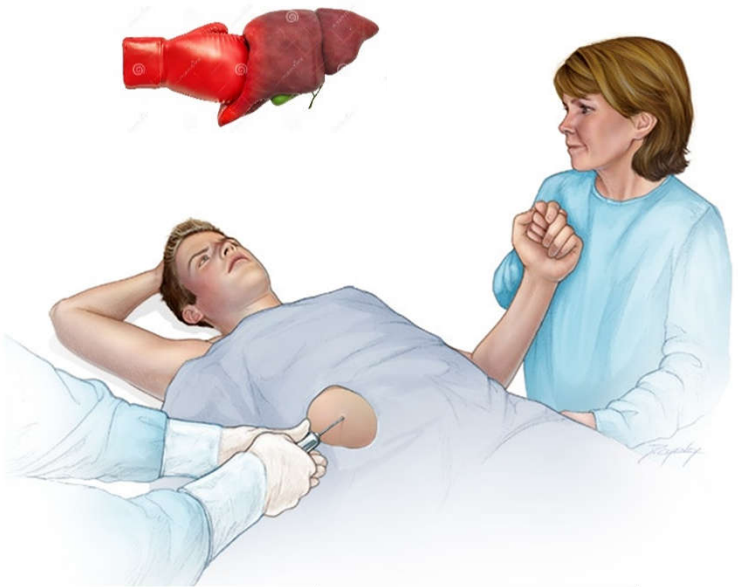
I.Methods of evaluation of liver fibrosis in Vietnam

WHY WE NEED STAGING FOR LIVER FIBROSIS

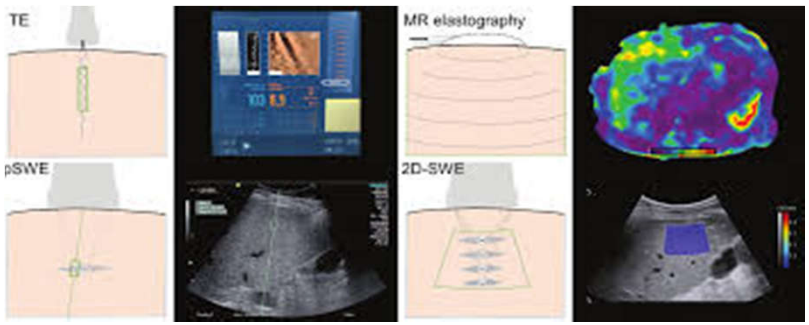
- 1. Assess stage and prognosis of disease
- 2. Decide on treatment (In case the treatment is costly and has many side effects)
- 3. Monitor and assess effectiveness of treatment
- 4. Detect HCC early and make differential diagnosis of liver tumor.

METHODS OF EVALUATION OF LIVER FIBROSIS

Liver Biopsy.



Serum Biomarkers & Elastography.



Serum Biomarkers used in Vietnam

1. APRI
2. FiB4
3. Fibrotest & Actitest
4. New: M2BPGi

II. M2BPGi is useful in evaluation of effective treatment

Mak et al. *Clinical and Translational Gastroenterology* (2018)9:163
DOI 10.1038/s41424-018-0020-9

Clinical and Translational Gastroenterology

ARTICLE Open Access

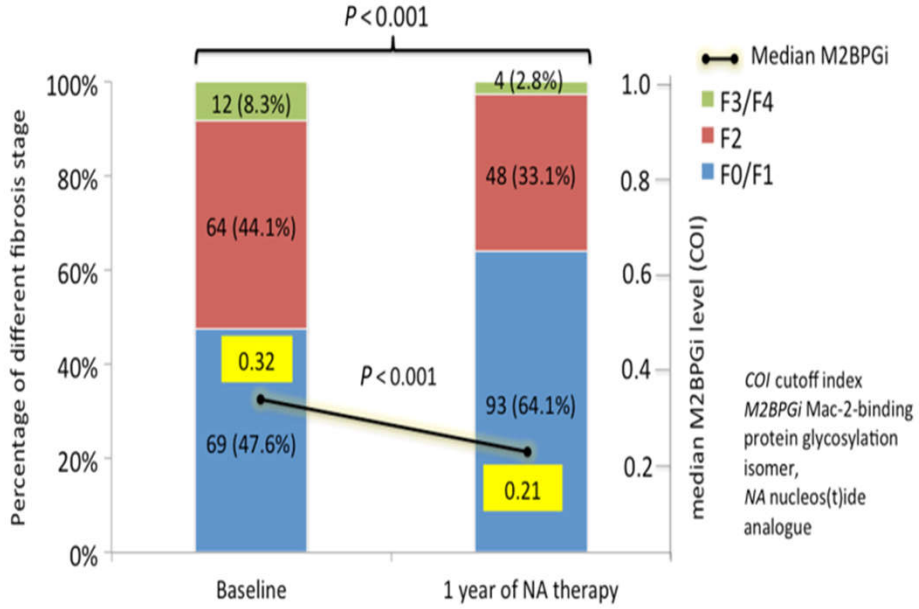
Role of serum M2BPGi levels on diagnosing significant liver fibrosis and cirrhosis in treated patients with chronic hepatitis B virus infection

Lung-Yi Mak[1], Danny Ka-Ho Wong[1,2], Ka-Shing Cheung[1], Wai-Kay Seto[1,2], Ching-Lung Lai[1,2] and Man-Fung Yuen[1,2]

Retrospective
Patients: 327 HBV, NA-treated
1994 – 2013, Hong Kong

Identify fibrosis : Biopsy
(All samples of biopsy: pos+ staining for HBsAg)

Evaluate fibrosis: Ishak Score



Median M2BPGi levels (COI) according to fibrosis stage at baseline and year 1

Fig. 4 Distribution of fibrosis stage and median serum M2BPGi level at baseline and after 1 year of nucleos(t)ide analogue therapy

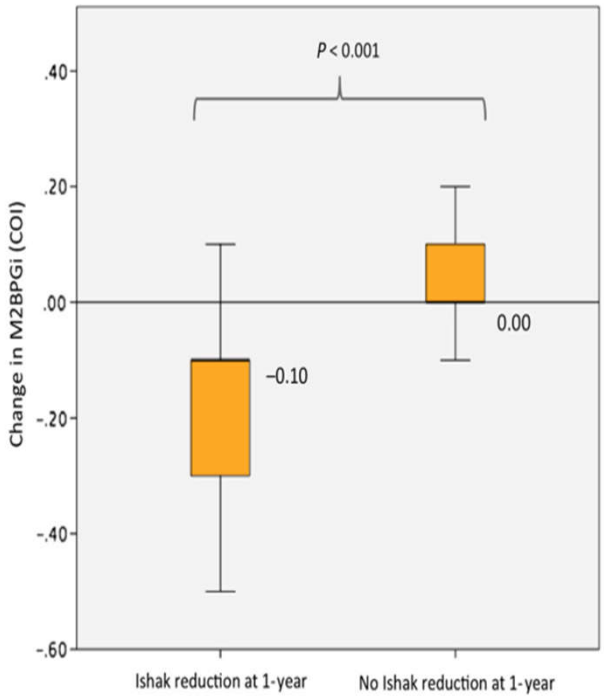


Fig. 5 Change of serum M2BPGi levels after 1 year of nucleos(t)ide analogue therapy with respect to change in histological fibrosis stage

Case 1: Chronic hepatitis C- Patient monitoring

- 76 year-old man
- Significant alcohol consumption (>30 years)
- To quit alcohol after being diagnosed with hepatitis C (HCV) in 2010- No HBV
- No operation in the past
- Brother: HCV
- Stable hypertension
- Refused anti- viral treatment due to financial reason.

Case 1: Chronic hepatitis C- Patient monitoring

- Received anti-viral treatment for HCV in 2020

Treatment regime: 12 weeks

Sofosbuvir 400mg

Velpatasvir 100mg

Case 1: Chronic hepatitis C- Patient monitoring

Diagnosed with HCV	Treatment initiation (August 2020)	End of treatment (EOT)	12 weeks after EOT (SVR 12)
Liver enzymes AST(U/L)	74	30	27
ALT (U/L)	78	32	28
Tumor marker AFP (ng/mL)	3.2	2.5	2.1
Viral load HCVRNA (IU/mL)	19,300,000	Negative	Negative
Genotype 1			
Fibrosis Marker : M2BPGi	3.24	1.50	1.14
Ultrasound : Doppler	Cirrhosis	Chronic hepatitis	Chronic hepatitis
Elastography: FibroScan(kPa)	17.3	16.9	16.5

Case 1: Chronic hepatitis C- Patient monitoring FibroScan

3 months of treatment

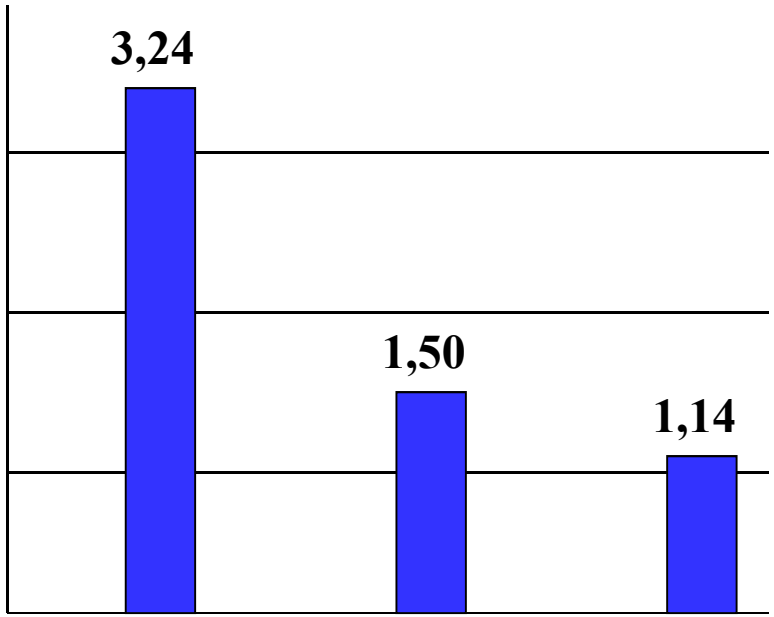
3 months of follow up

F4: 17.3 kPa

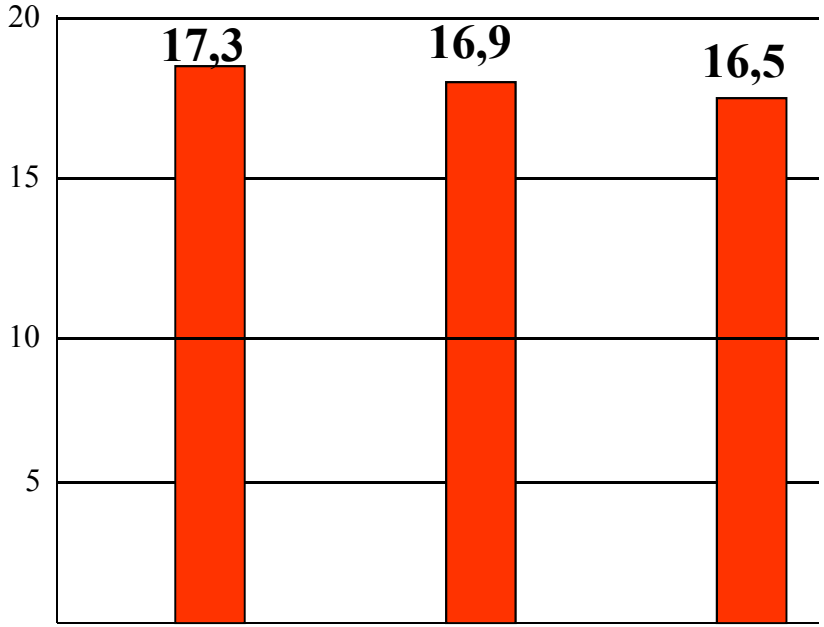
F4: 16.9 kPa

F4: 16.5 kPa

Evaluation improvement of liver fibrosis after 3 months of treatment- Comparison between M2BPGi & FibroScan



M2BPGi every 3 months



FibroScan every 3 months

Case 1: Chronic hepatitis C- Patient monitoring

Comments:

- M2BPGi is a dynamic test that can reflect the liver fibrosis progression . M2BPGi levels can be more reflective liver fibrosis activation process, while imaging methods measure liver stiffness which is not dynamic and might be not changing.

- M2BPGi can represent the liver fibrosis of the whole liver rather than a specific area of liver fibrosis.

III. M2BPGi can predict HCC developments

Reference	Etiology	Treatment status	Threshold of M2BPGi for HCC risk	HR (95% CI)
Yamasaki, *et al.* [31]	HCV		≥4	8.3 (1.8–38)
Tamaki, *et al.* [32]	HCV		≥4.2	4.1 (1.1–15)
			≥0.3 increase/yr	5.5 (1.5–19)
Inoue, *et al.* [36]	HCV		≥4 (mortality risk)	
Sasaki, *et al.* [48]	HCV SVR		≥2.0	5.7 (1.7–20)
Nagata, *et al.* [49]	HCV SVR		≥1.8	2.0 (1.4–2.4)
Yasui, *et al.* [50]	HCV SVR		≥1.75	6.0 (1.8–19)
Akuta, *et al.* [51]	HCV SVR		≥1.0	4.9 (1.4–18)
Ichikawa, *et al.* [53]	HBV	Naive	≥0.71	8.3 (1.0–67)
Jun, *et al.* [58]	HBV	Naive	Each 1 increase	1.1 (1.05–1.18)
Liu, *et al.* [62]	HBV	Naive	≥2.0 (1–2 yr HCC)	7.4 (2.4–23)
Kim, *et al.* [63]	HBV	Naive	≥1.8	1.5 (1.1–2.1)
Mak, *et al.* [64]	HBV	NA treatment	≥1.15 before NA treatment	1.2 (1.04–1.5)
Kawaguchi, *et al.* [65]	HBV	NA treatment	≥1.2 after NA treatment	10.5 (3.0–38)
Shinkai, *et al.* [66]	HBV	NA treatment	≥1.2 after NA treatment	5.0 (1.7–15)
Su, *et al.* [67]	HBV	NA treatment	Each 1 increase after NA treatment	1.6 (1.2–2.1)
Heo, *et al.* [68]	HBV	Naive/NA treatment	≥1.8	11.5 (1.4–97)
Mak, *et al.* [69]	HBV	Naive/NA treatment	≥0.68	4.7 (1.3–17)
Kawanaka, *et al.* [79]	NAFLD		≥1.255	1.7 (1.1–2.3)

Nobuharu Tamaki et al. Annals of Laboratory Medicine 2021

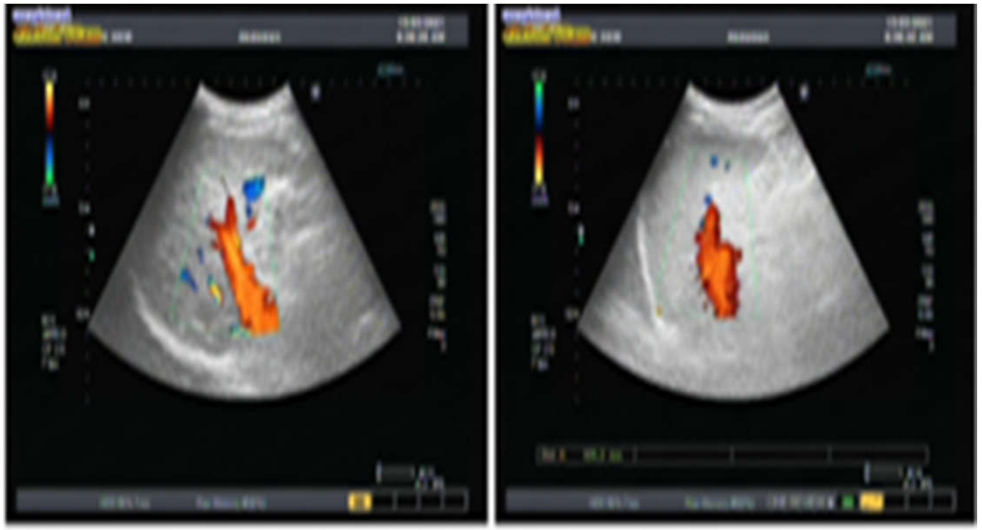
Case 2 :M2BPGi in predicting risk of HCC

- 44 year-old man
- Significant alcohol consumption (>20 years)
- Smoking (> 20 years, 5 cigarettes a day)
- Diabetes is stable
- Parents and two sisters: HBV
- Being diagnosed with hepatitis B in 2000- No HCV
- Refused treatment and visited doctor
- Pain in the right upper quarrant, fatigue----→ Medic Medical Center

Case 2 :M2BPGi in predicting risk of HCC

- HBsAg : Positive
- HBeAg : Positive
- AntiHBcIgM: Negative
- AntiHCV: Negative
- Ultrasound:

Cirrhosis with many regenerative nodules

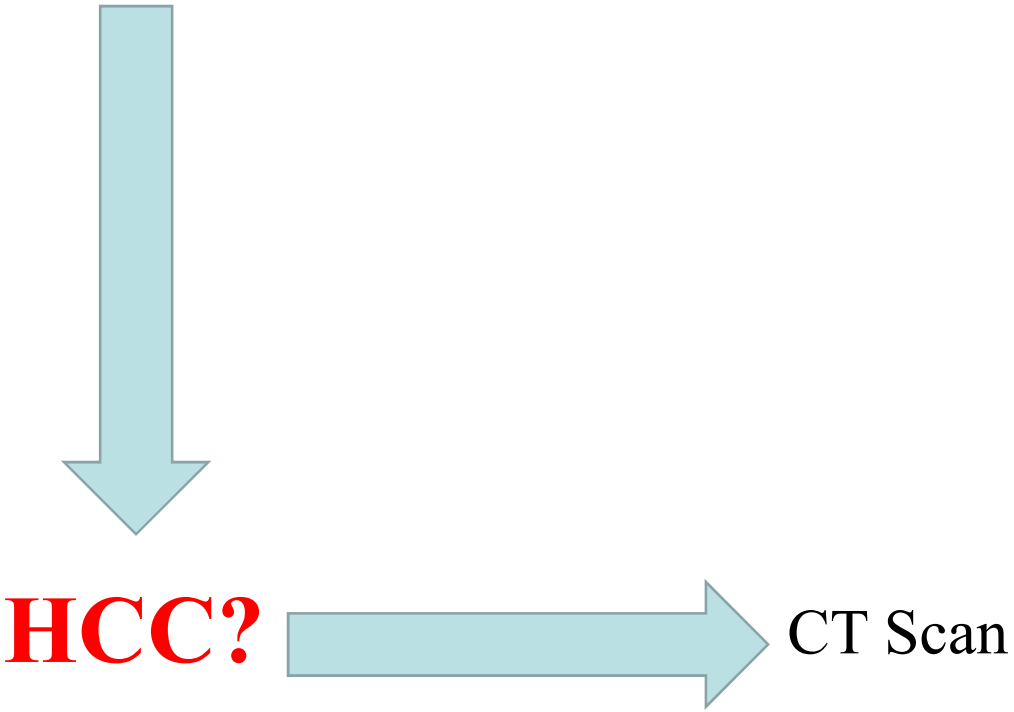


Case 2 :M2BPGi in predicting risk of HCC

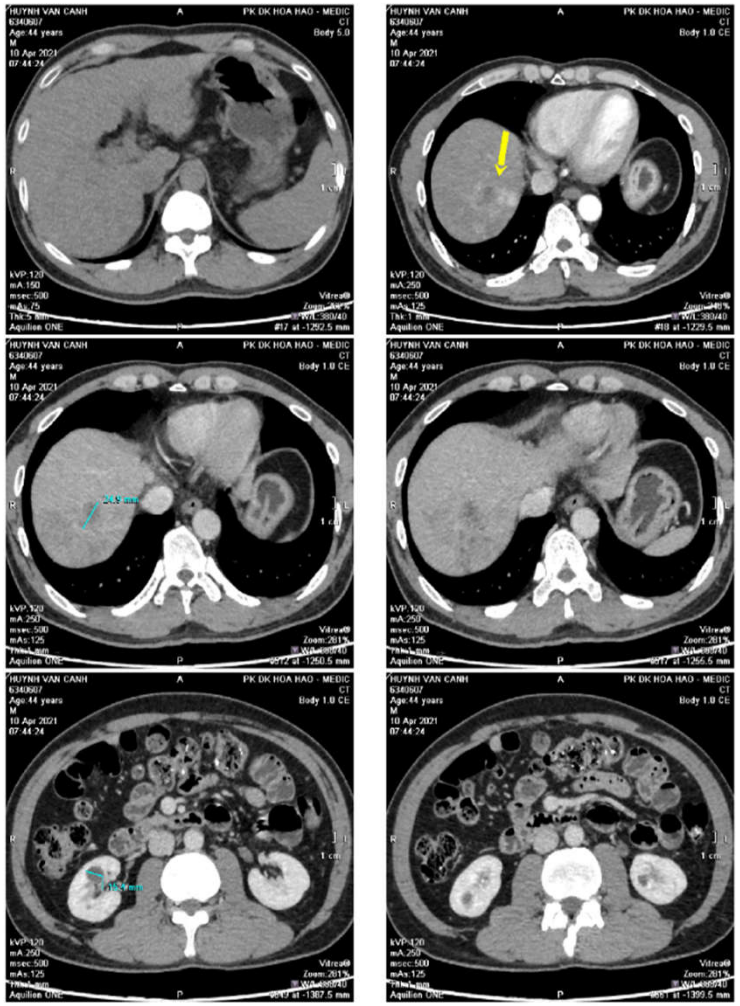
Diagnosed with HBV and cirrhosis	Treatment initiation (TDF)	After one month	
Liver enzymes AST(U/L)	54	52	
ALT (U/L)	57	55	
Tumor marker AFP (ng/mL)	12.4	14.7	???
Viral load HBV DNA (IU/mL)	162,740	Negative	
Fibrosis Marker : M2BPGi	3.21	3.8	???
Ultrasound : Doppler	Cirrhosis	Cirrhosis	???
Elastography: FibroScan (kPa)	18.5		

Case 2 :M2BPGi in predicting risk of HCC

- AFP-L3: 27.3%
- PIVKAII: 342 mAU/mL



Case 2 :M2BPGi in predicting risk of HCC
CT Scan



Some lesions 7-25mm ----HCC/ Chronic hepatitis

Case 2 :M2BPGi in predicting risk of HCC

Comments:

M2BPGi can predict HCC

A patient can have very small tumor which cannot be detected by ultrasound.

Chronic hepatitis + M2BPGGi----→ HCC???

IV. CONCLUSION

- Liver fibrosis progressing to cirrhosis is the leading cause of death in chronic liver diseases. Early evaluation of liver fibrosis is crucial.
- There are non-invasive techniques for evaluation liver fibrosis, each technique has it own advantages and disadvantages
- Clinicians use knowledge, experience and available techniques for suitable patients.
- M2BPGi is a useful and predictive serum marker for evaluating liver fibrosis and predicting HCC.
- M2BPGi has different cutoff points, up to causes, races, countries. Further studies on M2BPGi should apply to have more experiences.
